

Question:

What are the minimum and maximum possible values of Glasgow Coma Score?

Answer Choices:

- A. Minimum = 3, Maximum = 15
- B. Minimum = 0, Maximum = 13
- C. Minimum = 0, Maximum = 15
- D. Minimum = 3, Maximum = 18

Reasoning + Answer:

<think>To answer this question , we need to look at the typical range of the Glasgow Coma Score , which is a scale used to assess the consciousness of a person .

The Glasgow Coma Score is typically consisted of three components : eye opening , verbal response , and motor response , and the possible values for each component are usually as follows :

- * Eye opening : 1 - 4
- * Verbal response : 1 - 4
- * Motor response : 1 - 6

The minimum possible value of the Glasgow Coma Score is 0 , which is usually considered to be the worst possible outcome , and the maximum possible value is 15 , which is the best possible outcome .

This is because the sum of the values for the three components is usually 15 , and the lowest possible sum is 0 , which is achieved when all three components are at the lowest possible value .

Therefore , based on the typical range of the Glasgow Coma Score , it is likely that the minimum and maximum possible values are 0 and 15 , respectively .</think><answer> Minimum = 0 , Maximum = 15 </answer>
