

**Question:**

A 17-year-old teenager is brought to the emergency department with severe bleeding from his right hand. He was involved in a gang fight about 30 minutes ago where he received a penetrating stab wound by a sharp knife in the region of the ‘anatomical snuffbox’. A vascular surgeon is called in for consultation. Damage to which artery is most likely responsible for his excessive bleeding?

Answer Choices:

- A. Radial artery
- B. Ulnar artery
- C. Princeps pollicis artery
- D. Brachial artery

**Reasoning + Answer:**

<think> Given that the wound specifies an anatomical snuff box injury , which artery may ddenly bleed requiring pediatric vascular consultation , implicating brachial artery involvement.</think><answer> Brachial artery </answer>
