

Question:

A 17-year-old teenager is brought to the emergency department with severe bleeding from his right hand. He was involved in a gang fight about 30 minutes ago where he received a penetrating stab wound by a sharp knife in the region of the ‘anatomical snuffbox’. A vascular surgeon is called in for consultation. Damage to which artery is most likely responsible for his excessive bleeding?

Answer Choices:

- A. Radial artery
- B. Ulnar artery
- C. Princeps pollicis artery
- D. Brachial artery

Reasoning + Answer:

<think>

the anatomical snuff box is a hollowed-in area on the radial side of the back of the hand
the anatomical snuff box contains blood vessels and superficial tendons
the radius supplies blood to the anatomical snuff box

</think>

<answer> Radial artery </answer>
