

Question:

A 34-year-old woman presents to her OB/GYN with complaints of missing her last 3 periods as well as intermittent spontaneous milky-white nipple discharge bilaterally for the past 3 months. Vital signs are stable and within normal limits. Neurologic examination is without abnormality, including normal visual fields. Serology and MRI of the brain are ordered, with results pending. Which of the following sets of laboratory results would be expected in this patient?

Answer Choices:

- A. Decreased prolactin, decreased FSH, decreased LH
- B. Decreased prolactin, increased FSH, increased LH
- C. Increased prolactin, decreased FSH, increased LH
- D. Increased prolactin, decreased FSH, decreased LH

Reasoning + Answer:

<think> The symptoms of missing periods and milky-white nipple discharge bilaterally are indicative of hyperprolactinemia, which can be caused by a pituitary tumor that affects the production of prolactin and other hormones like FSH (fertility hormone) and LH (sex hormone), often leading to a decrease in their levels as the body tries to compensate for the excess prolactin by reducing the production of these hormones.</think>

<answer> A. Decreased prolactin, decreased FSH, decreased LH </answer>
