

Question:

There are 20 students in Miss Susan's class. 5 of them are good at math only, 8 of them perform well in English only, and the rest are good at both math and English. How many are good at math?

Reasoning + Answer:

<think>There are 5 students good at math only. There are 8 students good at English only. There are a total of $5 + 8 = 13$ students good at only one subject. There are 20 students total. So, $20 - 13 = 7$ students are good at both math and English. So, the total good at math is the 5 good at math only + 7 good at both = 12. Therefore, 12 students are good at math. </think>
<answer>12</answer>
