

Question:

Ralph has a record store where people can trade their own records for new ones. People can trade 2 old records for 1 new one. 5 people come in with old records and leave with 7 new records between them. How many old records did the 5 people bring in?

Reasoning + Answer:

<think> Ralph is running a record store where people can trade their old records for new ones. So, the ratio of old records to new records is 2 : 1. Now, 5 people come in and leave with 7 new records. This means that the total number of new records distributed is 7. If 5 people get 7 new records, then each person gets $7 / 5 = 1.4$ new records. But since we cannot have a fraction of a record, it's not possible for each person to get 1.4 new records. So, this interpretation seems not to be correct. Let's re-interpret the situation. If 5 people come in and leave with 7 new records, it means 7 new records are being given away. This means, for every new record given away, 2 old records were taken as a trade. So, if 7 new records are given away, then the number of old records taken as a trade will be $7 * 2 = 14$. So, the total number of old records brought by 5 people is 14.</think><answer>14</answer>
