

Question:

A DVD can be played 1000 times before it breaks. There are two DVDs in the public library, one has been played 356 times and the other has been played 135 times. How many total times can both DVDs be played before they break?

Reasoning + Answer:

<think> DVD can be played 1000 times before it breaks. So, total number of times both DVDs can be played is 1000. Now, already 356 times one DVD has been played. So, remaining life of this DVD is $1000 - 356 = 644$ times. Similarly, already 135 times other DVD has been played. So, remaining life of this DVD is $1000 - 135 = 865$ times. Total number of times both DVDs can be played is sum of remaining life of both DVDs. So, Total number of times = $644 + 865 = 1509$. Therefore, Total number of times both DVD can be played before they break is 1509. </think> <answer>1509</answer>
