

Question:

Billy is volunteering his time to help people do their taxes. He can help 2 people per hour for 3 hours a day. If he takes 20% of the days between March 1st and April 19th off, and helps people on all the other days. How many people does he help? (Remember there are 31 days in March.)

Reasoning + Answer:

<think> Billy can help 2 people per hour. So, in 3 hours he can help $2 * 3 = 6$ people per day. Now, if he does this for all the days in March, which has 31 days, then he can help $6 * 31 = 186$ people in March. Next, he takes 20% of the days between March 1st and April 19th off. So, number of days he takes off = 20% of 18 days = $(20 / 100) * 18 = 3$ days. So, he will not help on these 3 days. Hence, total number of people he helps = People he helps in March + People he helps in remaining days. People he helps in remaining days = $31 - 3 = 28$ days. So, total people he helps = $186 + 28 = 214$. Therefore, Billy helps 214 people </think> <answer> 214 </answer>
