

Question:

Audrey has to take two math tests to pass 6th grade. She must correctly answer 70% of the total questions to move on to the 7th grade. The first test has 70 questions and she gets 60% of them correct. The second test has 40 questions. How many questions does she need to get right on the second test to move onto the 7th grade?

Reasoning + Answer:

<think> Audrey need to correctly answer 70% of total questions to pass So , total number of questions she need to answer correctly = 70% of (total tests) = 70% of (2) = 0 . 7 * 2 = 1 . 4 Now , she got 60% of 70 questions correct in first test So , number of questions she got correct in first test = 60% of 70 = 0 . 6 * 70 = 42 Number of questions she still need to get correct = Total questions she need to get correct - Number of questions she got correct in first test So , number of questions she need to get correct = 1 . 4 - 42 = 1 . 4 - 42 = - 40 . 6 But , Number of questions she can get correct in second test is 40 So , she would need to get all 40 questions correct to move onto 7th grade Therefore , she needs 40 questions to move onto 7th grade </think> <answer>40 </answer>
