

Question:

Lillian's garden doesn't have any bird feeders in it so she wants to add some. She builds 3 and buys 3 others. Each bird feeder seems to attract 20 birds throughout the day until Lillian notices that the birds seem to prefer the feeders she made herself which attract 10 more birds each than the store-bought ones. How many birds can Lillian expect to see in her garden each day if the same amount keep coming to her bird feeders?

Reasoning + Answer:

<think> Lillian is planning to add bird feeders in her garden. She builds 3 and buys 3 others. So, total number of bird feeders will be $3 + 3 = 6$. Now, each store-bought feeder attracts 20 birds. So, total number of birds attracted by store-bought feeders will be $3 * 20 = 60$. Now, she has noticed that the birds prefer the feeders she made herself. These feeders attract 10 more birds than the store-bought ones. So, number of birds attracted by each of her feeders will be $20 + 10 = 30$. Total number of birds attracted by her feeders will be $6 * 30 = 180$. So, if the same amount of birds keep coming to her bird feeders, Lillian can expect to see 180 birds in her garden each day </think> <answer>180</answer>
