

Question:

When Marcus wakes up, his house is 40 degrees. He spends 3 hours baking, and every hour the oven is on it raises the house's temperature by 5 degrees. Then Marcus opens a window for 30 minutes, and the house cools down 2 degrees for every 10 minutes the window is open. What is the house's final temperature?

Reasoning + Answer:

<think> First, I will first find out the total increase in temperature after 3 hours, Since, the temperature increases by 5 degrees in every hour, So, Total increase = 5 * 3 = 15 degrees, So, The temperature after 3 hours = 40 + 15 = 55 degrees, Now, I will now find out the temperature after the window is opened, The window is open for 30 minutes, so it cools the house for 2 degrees in 10 minutes, So, it will cool the house for (2 * 3) = 6 degrees, So, final temperature = 55 - 6 = 49 degrees, </think><answer> 49</answer>
