

Question:

In one year, the number of students on campus doubles at the end of every month. If there are 10 students on campus at the beginning of the year, how many additional students would have joined by the end of May, above and beyond the number of students already on campus at the beginning of the year?

Reasoning + Answer:

<think> First, me find total number of students at the end of 1 st month, If there are 10 students at the beginning, then at the end of 1 st month, will be $10 * 2 = 20$, At the end of 2 nd month, will be $20 * 2 = 40$, At the end of 3 rd month, will be $40 * 2 = 80$, At the end of 4 th month, will be $80 * 2 = 160$, At the end of 5 th month, will be $160 * 2 = 320$, So, Additional students by the end of 5 th month = $320 - 10 = 310$, </think><answer> 310 </answer>
