

Question:

Out of the 200 Grade 5 students, $\frac{2}{5}$ are boys and $\frac{2}{3}$ of the girls are in the girl scout. How many girls are not in the girl scout?

Reasoning + Answer:

<think> First, we first find total number of girls in the class, Since, total students = 200, and, number of boys = $\frac{2}{5}$ of 200 = 80, So, number of girls = $200 - 80 = 120$, Now, I, find out the number of girls in the girl scout, $\frac{2}{3}$ of 120 = 80, So, number of girls in the girl scout = 80, Now, to find out the number of girls not in the girl scout, I, subtract the number of girls in the girl scout from the total number of girls, So, number of girls not in the girl scout = $120 - 80 = 40$, </think><answer> 40 </answer>
