

Question:

In a student council election, candidate A got 20% of the votes while candidate B got 50% more than candidate A's votes. The rest of the votes was given to candidate C. If there were 100 voters, how many votes did candidate C get?

Reasoning + Answer:

<think> First, me first find out votes of candidate A, 20% of 100 is $(20 / 100) * 100 = 20$, Now, I will find out votes of candidate B, 50% more than 20 is $(50 / 100) * 20 = 10$, So, total votes of candidate A and B = $20 + 10 = 30$, Now, I will find out votes of candidate C, Total votes = 100, So, votes of candidate C = $100 - 30 = 70$, </think>
><answer> 70</answer>
