

Question:

Regina wrote 9 novels last year. If this is 3 quarters of the number of novels she has written this year, how many novels has she written this year?

Reasoning + Answer:

<think> First, I first find out, total number of novels she has written, Since, 9 is 3 quarters of the number of novels she has written this year, So, total number of novels = $9 \times 4 = 36$, Now, to find out the number of novels she has written this year, I will divide 36 by 2, So, number of novels she has written this year = $36 / 2 = 18$, </think> <answer> 18 </answer>
