

Question:

15 gallons of gas were equally divided into 5 different containers. Josey needed $\frac{1}{4}$ of a container to run her lawnmower. How many pints of gasoline did Josey need?

Reasoning + Answer:

<think> she got $15 / 5 =$ << $15 / 5 = 3$ >> 3 gallons in one container 1 gallon = 2 pints. so 3 gallons = $3 * 2 =$ << $3 * 2 = 6$ >> 6 pints she needed $1 / 4$ of 3 = $3 / 4 =$ << $3 / 4 = 0.75$ >> 0.75 gallons so $0.75 \text{ gallons} = 0.75 * 2 =$ << $0.75 * 2 = 1.5$ >> 1.5 pints so Josey needed 1.5 pints </think> <answer> 1.5 </answer>
