

Question:

A certain company is in the business of selling fresh fruit. One crate of such fruit consists of 5 bananas, 12 apples, and 7 oranges. The price for such a crate depends on the price of its individual fruits. One apple costs \$0.5 and one banana costs twice as much. Oranges are the most expensive and cost three times as much as a banana per piece. What would be the price for such a crate of fruit?

Reasoning + Answer:

<think>the price of one apple is 0.5 dollars, the price of one banana is twice as much as an apple, so the price of one banana is $0.5 * 2 = 1$ dollar, the price of one orange is three times as much as a banana, so the price of one orange is $1 * 3 = 3$ dollars, now the crate consists of 5 bananas, 12 apples, and 7 oranges, so the total cost of bananas is $5 * 1 = 5$ dollars, the total cost of apples is $12 * 0.5 = 6$ dollars, and the total cost of oranges is $7 * 3 = 21$ dollars, so the total price for the crate of fruit is the sum of the cost of bananas, apples, and oranges, which is $5 + 6 + 21 = 32$ dollars</think><answer> 32</answer>
