

Question:

On a particular week, a tow truck pulled ten cars for each of the first three days and then four fewer cars on each of the remaining days of the week. Calculate the total number of cars it towed that week.

Reasoning + Answer:

<think>the tow truck pulled 10 cars for each of the first three days , so the total number of cars pulled in the first three days is $10 * 3 = 30$, now for the remaining days of the week , there are $7 - 3 = 4$ days , and on each of these days , the truck pulled 4 fewer cars than 10 , so the number of cars pulled on each of the remaining days is $10 - 4 = 6$, so the total number of cars pulled in the remaining 4 days is $6 * 4 = 24$, now to find the total number of cars pulled in the whole week , we add the number of cars pulled in the first three days and the number of cars pulled in the remaining 4 days , so the total number of cars pulled in the whole week is $30 + 24 = 54$ </think><answer> 54 </answer>
