

Question:

For a New Year's resolution, Andy wants to lose 30 lbs. by his birthday, which is July 19th. Today is December 31st. If Andy needs to burn 3500 calories to lose a pound, how much of a calorie deficit (net amount of calories burned vs. calories consumed) does he need each day to reach his goal?

Reasoning + Answer:

<think>to find the total number of days Andy has to lose 30 pounds, we first need to find the total number of days between December 31st and July 19th, the total number of days is 193, now if Andy needs to lose 30 pounds and he burns 3500 calories to lose a pound, the total number of calories he needs to burn is $30 * 3500 = 105000$, to find the daily calorie deficit, we divide the total number of calories by the total number of days, so the daily calorie deficit is $105000 / 193 = 545$ </think> <answer> 545 </answer>
