

Question:

Becky bought 20 apples for 45 cents each and received a \$1 discount. Kelly bought 20 apples for 50 cents each and received a 10 percent discount. How much more did Kelly pay than Becky?

Reasoning + Answer:

<think>The cost of 20 apples for Becky is $20 \times 45 = 900$ cents, which is 9 dollars
So, she received a \$1 discount, so she paid $9 - 1 = 8$ dollars
The cost of 20 apples for Kelly is $20 \times 50 = 1000$ cents, which is 10 dollars
With a 10% discount, she paid $10 \times (1 - 10\%) = 10 \times 0.9 = 9$ dollars
The difference in the amount they paid is $10 - 8 = 2$ dollars
</think><answer>2</answer>
