

Question:

There is one set of twins and one set of triplets. One twin is 7 years older than one triplet. If their combined ages are 44, how old is one of the twins?

Reasoning + Answer:

<think>Let's denote the age of one triplet as x years
 So , the age of the other triplet would be x years
 And the age of one twin would be $x + 7$ years
 The combined ages of the twins and the triplets are 44 years
 So , we can write the equation: $2(x + 7) + x + x = 44$
 Simplifying the equation, we get: $2x + 14 + x + x = 44$
 $4x + 14 = 44$
 $4x = 30$
 $x = 7.5$ years for one triplet
 Therefore, the age of one twin would be $7.5 + 7 = 14.5$ years
 </think> <answer>14.5</answer>
