

Question:

Mike plays ping pong for 40 minutes. In the first 20 minutes, he scores 4 points. In the second 20 minutes, he scores 25% more points. How many total points did he score?

Reasoning + Answer:

<think>Mike scores 4 points in the first 20 minutes. In the second 20 minutes, he scores 25% more points than in the first 20 minutes. The number of points he scores in the second 20 minutes is : $[4 + 4 \times \frac{25}{100} = 4 + 1 = 5 \text{ points}]$ Thus, the total number of points he scores is : $[4 + 5 = 9 \text{ points}]$ </think> <answer>9</answer>
