

Question:

Millie decides to open a lemonade stand. She spends \$18 to buy enough supplies to make 3 pitchers of lemonade. Each pitcher holds 12 cups of lemonade. She sells each cup of lemonade for \$1. She sells an average of 4 cups per hour that her lemonade stand is open. If Millie sells all of the lemonade, how much profit will she make per hour that she spends running the lemonade stand?

Reasoning + Answer:

`<think>` Millie spends \$18 to buy supplies for 3 pitchers of lemonade, so the cost per pitcher is :
$$\left[\frac{18}{3} = 6 \text{ dollars} \right]$$
 Each pitcher holds 12 cups of lemonade, so the total number of cups she can make is :
$$\left[3 \times 12 = 36 \text{ cups} \right]$$
 Since she sells each cup for \$1, the total revenue from selling all the lemonade is :
$$\left[36 \times 1 = 36 \text{ dollars} \right]$$
 Millie sells all of the lemonade, so her profit from selling all the lemonade is :
$$\left[36 - 18 = 18 \text{ dollars} \right]$$
 She sells all of the lemonade in 4 hours, so her profit per hour is :
$$\left[\frac{18}{4} = 4.5 \text{ dollars} \right]$$
`</think>``<answer>`4.5`</answer>`
