

Question:

Alex is getting ready to attend an event that she has hosted and wants to make sure that she has enough seats for everyone. She invites 100 people via email and each invited person says that they will also invite 2 of their friends. She then calls 10 of her friends to invite them too and 8 of them say they will be bringing their spouses. How many seats will Alex need?

Reasoning + Answer:

<think>Alex invites 100 people, and each of them invites 2 friends, so the number of additional people invited is: $[100 \times 2 = 200 \text{ people}]$ Then, she calls 10 of her friends, and 8 of them bring their spouses, so the number of additional people invited from these 10 friends is: $[8 \text{ people}]$ Thus, the total number of seats Alex needs is the sum of the people she initially invited, the additional people invited by the initial invitees, and the additional people invited by the friends who brought their spouses: $[100 + 200 + 8 = 308 \text{ seats}]$ </think><answer>308</answer>
