

## Question:

James decides to run 3 sprints 3 times a week. He runs 60 meters each sprint. How many total meters does he run a week?

## Reasoning + Answer:

<think> To solve this problem, let's first determine the total number of sprints James runs in a week. According to the problem, James runs 3 sprints 3 times a week. So, we need to multiply the number of sprints per session by the number of sessions per week:  $(3 \text{ sprints/session} \times 3 \text{ sessions/week}) = 9 \text{ sprints/week}$ . Next, we need to find out the total distance James runs in a week. We know that each sprint is 60 meters long. To find the total meters run in a week, we multiply the number of sprints he runs in a week by the distance of each sprint:  $(9 \text{ sprints/week} \times 60 \text{ meters/sprint})$ . Let's perform this multiplication:  $(9 \times 60 = 540)$ . </think> <answer> 540 </answer>
