

Question:

Every day, Wendi feeds each of her chickens three cups of mixed chicken feed, containing seeds, mealworms and vegetables to help keep them healthy. She gives the chickens their feed in three separate meals. In the morning, she gives her flock of chickens 15 cups of feed. In the afternoon, she gives her chickens another 25 cups of feed. How many cups of feed does she need to give her chickens in the final meal of the day if the size of Wendi's flock is 20 chickens?

Reasoning + Answer:

<think> To solve this problem, let's first calculate the total amount of feed given to the chickens in the morning and afternoon meals combined. According to the problem, Wendi gives 15 cups in the morning and 25 cups in the afternoon. So, we can add these two amounts together to find the total feed given in these meals: $(15 + 25 = 40)$ cups. Next, we need to determine the total amount of feed needed for all three meals of the day. The problem states that Wendi feeds each of her chickens three cups of feed per meal. Since she has 20 chickens in her flock, we can find the total feed needed for all chickens by multiplying the number of chickens by the number of cups each chicken receives per meal: $(20 \times 3 = 60)$ cups. Finally, to find out how many cups of feed are needed in the final meal of the day, we subtract the total feed given in the first two meals from the total feed required for all chickens. So, we subtract the 40 cups given in the morning and afternoon from the total 60 cups needed for all the chickens: $(60 - 40 = 20)$ cups. </think>
<answer> 20 </answer>
