

Question:

Charlotte went into the kitchen supply store knowing she wanted a set of pot and pans for \$120.00, a set of mixing bowls for \$20.00 and 5 separate utensils at \$5.00 each. At check out, the clerk told her everything was 20% off. How much was her order?

Reasoning + Answer:

<think>First let's calculate the total cost of the items before the discount. Charlotte wants to buy a set of pot and pans for 120.00 and a set of mixing bowls for 20.00. Additionally she wants to buy 5 separate utensils each costing 5.00 dollars. The total cost of the utensils is $5 * 5 = 25.00$ dollars. Now let's calculate the total cost before the discount. $120.00 + 20.00 + 25.00 = 165.00$ dollars. Now let's calculate the discount. The items are discounted by 20%. To calculate the discount amount. $165 * 0.2 = 33.00$ dollars. Now let's subtract the discount from the total cost. $165 - 33 = 132.00$ dollars. Therefore the total cost of the order is 132.00 dollars. </think><answer>132.00</answer>
