

Question:
Each solid 10-foot section of a redwood tree weighs 400 pounds. Termites ate 30% of this redwood's wood. If the redwood is 200 feet tall, how much does it weigh?

Reasoning + Answer:

<think> we know the redwood is 200 feet tall so we can first work out how many 10 foot sections there are in the whole tree by doing the tall number 200 divided by the sections size 10 so we do 200 split by 10 which equals 20 so now we know there's 20 sections in the whole tree then we know each section weighs 400 pounds so to work out the weight of all these sections we do the number of sections 20 times the weight of each section 400 so we do 20 times 400 which equals 8000 so now we know the whole tree weighs 8000 pounds but the question says the termites ate 30% of the tree so we need to take that off the total weight to work out 30% of 8000 we take the total weight 8000 and do 30 split by 100 which equals 80 point 3 then we do 80 point 3 times the total weight 8000 which equals 2400 so now we take the amount eaten by termites 2400 off the total weight 8000 so we do 8000 take away 2400 which equals 5600 so now we know the tree weighs 5600 pounds after the termites have eaten some </think><answer>5600</answer>
