

Question:

To make a profit of \$2000, Isaias has to sell the chickens he planned to take to the market from his farm at \$50 per chicken. If Isaias has 300 chickens on his farm and plans to sell $\frac{3}{5}$ of them, for how much money did Isaias buy the chicken he took to the market for sale?

Reasoning + Answer:

<think> we know isaias needs to make 2000 dollars in profit so we can write that down so we know he's going to sell some of his chickens for 50 dollars each to make that so we know he's going to sell 3 out of every 5 chickens he has so we can do the maths for that so we take the total number of chickens which we know is 300 and do 300 split into 5 equal parts because we know 3 out of 5 are going to be sold so we do 300 split by 5 which equals 60 so now we know 60 is the number of parts we need for the chicken to be sold then we take those 60 parts and multiply by 3 because we know 3 parts out of 5 are going to be sold 60 times 3 equals 180 so now we know 180 chickens are going to be sold now we know each chicken sells for 50 dollars so we take the 180 chickens and times them by the 50 dollars per chicken so we do 180 times 50 which equals 9000 so now we know he's going to get 9000 dollars selling the chickens but we know he needs a 2000 dollar profit so we need to work out what he bought the chickens for so we take the money he's going to get from selling the chickens which is 9000 and take the 2000 dollar profit away from it so we do 9000 take away 2000 which equals 7000 so now we know isaias bought the chickens he took to the market for 7000 dollars </think>
><answer>7000</answer>
