

Question:

It costs \$194 per meter to repave a street. Monica's street is 150 meters long. How much more does it cost to repave Lewis' street, which is 490 meters long?

Reasoning + Answer:

<think> we know it costs 194 dollars for every meter of street so we can write that down so first we do Monica's street which we know is 150 meters so we take the 194 dollars per meter and do that time the 150 meters we know Monica's street is so we do 194 times 150 which we can work out like this: 194 times 150 equals we can break it down to make it easier so we do 194 times 100 which we know is 19400 and then we do 194 times 50 which we know is half of 194 times 100 so half of 19400 is 9700 so now we add the two lot together 19400 and 9700 which equals 29100 so now we know Monica's street costs 29100 dollars to repave then we do the same for Lewis' street which we know is 490 meters so we take the 194 dollars per meter again and do that time the 490 meters we know Lewis' street is so we do 194 times 490 which we can work out like this: 194 times 490 we can break this down to make it easier so we do 194 times 500 which we know is 97000 then we do 194 times 10 which we know is 1940 so now we take the 97000 and take away the 1940 we know is 194 times 10 which we did earlier and we do 97000 take away 1940 which equals 95060 so now we know Lewis' street costs 95060 dollars to repave then we know to work out how much more Lewis' street costs we take the amount it costs to do Monica's street away from the amount it costs to do Lewis' street so we take Monica's 29100 dollars away from Lewis' 95060 dollars so we do 95060 take away 29100 which equals 65960 so now we know Lewis' street costs 65960 dollars more to repave than Monica's </think> <answer> 65960 </answer>
