

Question:

Gary does laundry twice a week. Each load of laundry uses 20 gallons of water, and a gallon of water costs \$0.15. How much does Gary spend on water for laundry in a year?

Reasoning + Answer:

<think> we know gary does his laundry twice a week so we can first work out how many loads he does in a year so we know there's 52 weeks in a year so we do the two loads a week times by 52 to work out his yearly loads so we do 2 loads a week times 52 weeks which equals 104 so now we know he does 104 loads a year then the question tells us each load uses 20 gallons of water so to work out the total gallons used in a year we take the 104 loads and times that by the 20 gallons per load so we do 104 times 20 which equals 2080 so now we know he uses 2080 gallons of water a year then the question tells us a gallon of water costs 15 cents so to work this out in dollars we know there's 100 cents in a dollar so we do the 2080 gallons divided by 100 to work out the dollar amount so we do 2080 divided by 100 which equals 20 point 8 so now we know the water cost Gary 20 point 8 dollars a year </think><answer>20.8</answer>
