

Question:

Cole wanted to buy new jeans for a dance contest. At the store, he couldn't decide between tattered jeans and jogger jeans. Since the jeans were on sale, he decided to buy them both. The tattered jeans cost \$28 while the jogger jeans cost \$6 less than the tattered jeans. He saved a total of \$6. If he saved 1/3 of the total savings from the jogger jeans and the rest from the tattered jeans, how much more do jogger jeans originally cost than the tattered jeans?

Reasoning + Answer:

<think> we know the tattered jeans cost 28 dollars so we can write that down so now we know the jogger jeans cost 6 dollars less than the tattered jeans so we do the tattered jeans cost 28 so we do 28 take away 6 which we do like this : 28 - 6 = 22 so now we know the jogger jeans cost 22 dollars so now we know in total cole saved 6 dollars the questions says she saved 1 lot from the joggers and 2 lots from the tattered jeans so we know from the joggers she saved 1 lot of the total 6 so we do 6 split into 3 equal parts because it says 1 lot was from the joggers and 2 lots from the tattered so we do 6 split by 3 which we write like 6 / 3 = 2 so we know 2 dollars was saved on the joggers so now we know 2 dollars was saved on the joggers so we take the joggers sale price of 22 and add the 2 dollar saving back on so 22 + 2 = 24 so now we know the original jogger jeans cost 24 dollars so now we know the tattered jeans cost 28 dollars and the original jogger jeans cost 24 dollars so now we take the tattered jeans price of 28 and take away the joggers price of 24 so 28 - 24 = 4 so now we know the jogger jeans originally cost 4 dollars more than the tattered jeans </think><answer>4 </answer>
