

Question:

Clinical study looks at the effect of childhood exposure of 2nd-hand smoking on the incidence of bronchogenic adenocarcinoma (BA). Study of 100 subjects (50 exposed to childhood 2nd-hand smoking and 50 healthy controls with no childhood exposure) involves monitoring the lifetime incidence of BA data from the study are shown in the table below:

Group	BA Dx	Yes	No
Exposed	18	32	43
Controls	7	43	32

Which of the following statements is correct regarding the number needed to harm (NNH) based on this study?

Answer Choices:

- A. If the incidence of BA increases in the control group, the NNH will decrease.
- B. If the incidence of BA increases in the experimental group, the NNH will increase.
- C. The NNH is inversely correlated with the relative risk increase.
- D. If the absolute risk in the exposed group increases, the NNH increases.

Reasoning + Answer:

<think>reasoning process here</think><answer> D . If the absolute risk in the exposed group increases , the NNH increases . </answer>
