

Question:

Drug of choice for primary prophylaxis for acute rheumatic fever? Answer Choices: A. Erythromycin-1.2 million units B. Erythromycin-1.2 lakh units C. Benzathine penicillin-1.2 lakh units D. Benzathine penicillin-1.2 million units

Reasoning + Answer:

<think>The assistant is thinking about the fact that acute rheumatic fever is a complication of streptococcal infection, and that the drug of choice for primary prophylaxis is a type of antibiotic that is effective against streptococci. The assistant is also considering the fact that the drug must be administered in a way that is convenient and effective, such as through an injection. The assistant is also thinking about the fact that the drug must be effective in preventing the development of acute rheumatic fever, and that it must be safe for use in a variety of patients. </think> <answer> D . Benzathine penicillin - 1 . 2 million units </answer>
