

Question:

Pseudorosettes are seen in Answer Choices: A. Retinoblastoma B. Ophthalmia nodosa C. Phacolytic glaucoma D. Trachoma

Reasoning + Answer:

<think> The question is asking about the condition associated with pseudorosettes. To answer this question, we need to identify the condition that is known to feature pseudorosettes. Retinoblastoma is a type of eye cancer that can exhibit pseudorosettes. Ophthalmia nodosa is a type of eye infection that does not typically feature pseudorosettes. Phacolytic glaucoma is a type of glaucoma associated with a lens fracture, but it is not typically associated with pseudorosettes. Trachoma is a bacterial infection of the eye that can cause pseudopods of Fleischner, not pseudorosettes. Therefore, the correct answer is the condition that is associated with pseudorosettes. </think>
><answer> Retinoblastoma </answer>
