

Question:

A 28-year-old man presents to his physician with a complaint of a 4-week history of headaches that is affecting his academic performance. Over-the-counter medications do not seem to help. He also mentions that he has to raise his head each time to look at the board when taking notes. His blood pressure is 125/75 mm Hg, pulse 86/min, respiratory rate 13/min, temperature 36.8°C (98.2°F). Ophthalmic examination shows an upward gaze palsy, convergence-retraction nystagmus, and papilledema. CT scan of the head reveals a 1.5 x 1.2 cm heterogeneous mass in the epithalamus with dilated lateral and 3rd ventricles. What other finding is most likely to be associated with this patient's condition? Answer Choices: A. Sensorineural hearing loss B. Pseudo-Argyll Robertson pupils C. Eyes down and out D. Conducting hearing loss

Reasoning + Answer:

<think>The patient is presenting with symptoms and signs suggestive of a neurological condition, specifically hydrocephalus and a mass in the epithalamus, which is characteristic of a Chiasmatic herniation. </think> <answer>Pseudo - Argyll Robertson pupils</answer>
