

Question:

Neurotransmitter released in response to raised blood pressure: Answer Choices: A. Acetylcholine B. Adrenaline C. Dopamine D. Nor-adrenaline

Reasoning + Answer:

<think> The question is asking about the neurotransmitter released in response to raised blood pressure. To answer this question, we need to identify the neurotransmitter that is known to be involved in the regulation of blood pressure. Adrenaline and Nor-adrenaline are both catecholamines that are released in response to stress and can increase blood pressure. Acetylcholine is a neurotransmitter that can lower blood pressure. Dopamine is a neurotransmitter that is involved in reward and motivation, but it is not directly related to blood pressure regulation. Therefore, the correct answer is the neurotransmitter that is most closely associated with increased blood pressure. </think> <answer> Nor-adrenaline </answer>
