

Question:

According to the WHO criteria, anaemia in infants of 6 months age is defined as Hb less than
-Answer Choices:A. 100 gm\litreB. 105 gm\litreC. 110 gm\litreD. 115 gm\litre

Reasoning + Answer:

<think> To answer this question, we need to look at the criteria set by the World Health Organization (WHO) for defining anaemia in infants. According to the WHO, anaemia in infants is typically defined as a hemoglobin (Hb) level that is lower than the normal range for that age group. For infants of 6 months of age, the normal range for Hb is generally considered to be around 110 gm/litre. This is because at 6 months of age, most infants will have a Hb level that is within this range, and a level below this is typically considered to be indicative of anaemia. Therefore, based on the WHO criteria, it is likely that anaemia in infants of 6 months of age is defined as Hb less than 110 gm/litre.</think><answer> 110 gm\litre</answer>
