

Question:

A 26-year-old woman presents to the clinic complaining of a headache, runny nose, and malaise. A few minutes into the interview, she mentions that she recently started her job and is glad to work long hours despite the toll on her health. However, she admits that she is finding it difficult to keep up with the workload. She has numerous pending papers to correct. When advised to seek help from other teachers, she exclaims that it needs to be done in a particular way, and only she can do it the right way. This is causing her to perform poorly at work, and she is at risk of being asked to quit her very first job. Which of the following is the most likely diagnosis in this patient? Answer Choices: A. Ego-syntonic obsessive-compulsive personality disorder B. Ego-syntonic obsessive-compulsive disorder C. Ego-dystonic obsessive-compulsive disorder D. Personality disorder not otherwise specified

Reasoning + Answer:

<think> To answer this question, we need to consider the patient's symptoms and behavior. The patient is experiencing a headache, runny nose, and malaise, which could be indicative of a number of possible conditions. However, the most likely diagnosis is likely to be ego-syntonic obsessive-compulsive personality disorder, which is a condition in which a person has a rigid and stubborn personality style that is causing them to insist on doing things in a particular way. This is consistent with the patient's admission that she is finding it difficult to keep up with the workload and is at risk of being asked to quit her job due to her performance. The other options are less likely to be the correct diagnosis because ego-dystonic obsessive-compulsive disorder is a condition in which a person feels a sense of distress or anxiety about their symptoms, which is not consistent with the patient's behavior. Personality disorder not otherwise specified is a catch-all diagnosis that is often used when a person's symptoms do not meet the criteria for a specific personality disorder. The patient's behavior and symptoms are most consistent with a diagnosis of ego-syntonic obsessive-compulsive personality disorder. </think> <answer> Ego-syntonic obsessive-compulsive personality disorder </answer>
