

Question:

A 12-year-old girl is presented to the office by her mother with complaints of cola-colored urine and mild facial puffiness that began 5 days ago. According to her mother, she had a sore throat 3 weeks ago. Her immunization records are up to date. The mother denies fever and any change in bowel habits. The vital signs include blood pressure 138/78 mm Hg, pulse 88/min, temperature 36.8°C (98.2°F), and respiratory rate 11/min. On physical examination, there is pitting edema of the upper and lower extremities bilaterally. An oropharyngeal examination is normal. Urinalysis shows the following results:pH 6.2Color dark brownRed blood cell (RBC) count 18–20/HPFWhite blood cell (WBC) count 3–4/HPFProtein 1+Cast RBC castsGlucose absentCrystal noneKetone absentNitrite absent24 h urine protein excretion 0.6 gHPF: high-power fieldWhich of the following would best describe the light microscopy findings in this case?Answer Choices:A. Wire looping of capillariesB. Hypercellular and enlarged glomeruliC. Segmental sclerosis and hyalinosisD. Mesangial proliferation

Reasoning + Answer:

<think>clinicalcontext, associations</think><answer>A . Wireloopingofcapillaries</answer>
