

Question:

A 6-week pregnant lady is diagnosed with sputum positive TB. Best management is -Answer
Choices:A. Wait for 2nd trimester to start ATT.B. Start Category I ATT in first trimesterC. Start
Category II ATT in first trimesterD. Start Category III ATT in second trimester

Reasoning + Answer:

<think>The best management for a 6-week pregnant lady diagnosed with sputum positive TB is to start Category I ATT (Anti-Tuberculosis Treatment) in the first trimester . This is because delaying treatment can be harmful to both the mother and the fetus . TB treatment is essential to prevent maternal morbidity and mortality , as well as to reduce the risk of transmission to the fetus . Category I ATT is the standard treatment regimen for new cases of pulmonary tuberculosis and is considered safe during pregnancy . It is recommended to start ATT in the first trimester , as it has a minimal risk of teratogenic effects and can help in preventing maternal and fetal complications. </think><answer> B . Start Category I ATT in first trimester </answer>
