

Question:

Fenestration operation is which type of tympanoplasty? Answer Choices: A. Type - 2 B. Type - 3 C. Type - 4 D. Type - 5

Reasoning + Answer:

<think> Fenestration operation is a surgical procedure that involves the creation of a window in the tympanic membrane and the outer ear to improve hearing. It is a type of tympanoplasty that is classified as Type 4. This procedure is typically performed to improve hearing in cases where the middle ear is filled with bone or other tissue, causing a conductive hearing loss. The fenestration operation creates a new pathway for sound waves to reach the inner ear, bypassing the blocked or damaged area. This type of tympanoplasty is considered Type 4 because it involves the creation of a new window in the ear, rather than simply repairing or replacing the existing structures. </think>
<answer> C . Type - 4 </answer>
