

Question:

A 21-year-old man presents to the clinic complaining of feeling tired during the day. He is concerned as his grades in school have worsened and he does not want to lose his scholarship. Upon further questioning, the patient describes frequently experiencing a dreamlike state before falling asleep and after waking up. He also has frequent nighttime awakenings where he finds himself unable to move. He denies snoring. The patient does not drink alcohol or abuse any other drugs. The patient's BMI is 21 kg/m², and his vital signs are all within normal limits. What is this patient's diagnosis? Answer Choices: A. Obstructive sleep apnea (OSA) B. Delayed sleep phase syndrome (DSPS) C. Narcolepsy D. Alcohol withdrawal

Reasoning + Answer:

<think>dreamlike state before falling asleep and after waking up to dreams (hypnagogic hallucination) is a sign of narcolepsy. Frequent night awakenings are associated with narcolepsy.</think><answer>C. Narcolepsy</answer>
