

Question:

A 35-year-old man developed headache, nausea, vomiting, and sore throat 8 weeks after returning from a trip abroad. He eventually refused to drink water and had episodes of profuse salivation, difficulty in breathing, and hallucinations. Two days after the patient died of cardiac arrest, it was learned that he had been bitten by a dog while on his trip. Which of the following treatments, if given immediately after the dog bite, could have helped prevent this disease? Answer Choices: A. Broad-spectrum antibiotics B. High-dose acyclovir C. IV ribavirin D. Rabies immune globulin plus rabies vaccine

Reasoning + Answer:

<think>The patient had a headache, nausea, and vomiting after a trip. He refused to drink water and had cardiac arrest. The dog bite was mentioned as a risk factor. Rabies was suspected. Broad-spectrum antibiotics, high-dose acyclovir, and IV ribavirin were potential treatments. Rabies immune globulin plus rabies vaccine could also prevent the disease. </think><answer>Rabies immune globulin plus rabies vaccine</answer>
