

Question:

A 68-year-old female presents to the emergency room with acute onset of dyspnea and hemoptysis. Her past medical history is unremarkable and she has had no prior surgeries. A ventilation-perfusion scan demonstrates a large perfusion defect that is not matched by a ventilation defect in the left lower lobe. Which of the following would you also expect to find in this patient: Answer Choices: A. Pleuritic chest pain B. Bradycardia C. Aortic dilation D. Claudication

Reasoning + Answer:

<think>The patient's symptoms of acute onset dyspnea and hemoptysis along with a ventilation-perfusion scan showing a large perfusion defect that is not matched by a ventilation defect in the left lower lobe are indicative of a possible pulmonary embolism, which is a blood clot in the lung that can cause pleuritic chest pain as the clot can irritate the pleura and lead to sharp pain in the chest that worsens with breathing.</think><answer>A . Pleuritic chest pain</answer>
