

Question:

The radiograph of a 32 year old patient is shown below. The patient is asymptomatic and the lesion revealed in the radiograph is an accidental finding. The most likely diagnosis is: Answer Choices: A. Stafne's bone cavity B. Radicular Cyst C. Dentigerous cyst D. Lateral periodontal cyst

Reasoning + Answer:

<think> The lesion in the radiograph is a well defined radiolucent lesion that is located in the root bifurcation of a fully erupted tooth and is the most common benign odontogenic tumor that presents as an asymptomatic radiolucent lesion in the root bifurcation in an older person and is a false negative for any infection and is not related to the eruption of the tooth and is a Stafne bone cavity which is a type of radiopaque hypermineralized crypt in the jaw that appears as a lucent area in the xray around it because it is resorbing the roots of the adjacent teeth </think> <answer> A . Stafne's bone cavity </answer>
