

Question:

Actions of cholecystokinin include which one of the following? Answer Choices: A. Contraction of gall bladder B. Secretion of pancreatic juice rich in enzymes C. Increases the secretion of enterokinase D. All

Reasoning + Answer:

<think>Cholecystokinin causes the gall bladder to contract and release bile and it also induces the pancreas to release pancreatic juice that is rich in enzymes which will then be delivered to the small intestine through the pancreatic duct in response to cholecystokinin stimulation and this includes the release of digestive enzymes from the pancreatic juice </think> <answer> B . Secretion of pancreatic juice rich in enzymes </answer>
