

Question:

40 yr old female presented with breast lump of size 4 cm with involvement of skin and mobile palpable axillary LN, FNAC of lesion showed intraductal carcinoma. What is the initial management of for this pt? Answer Choices: A. Radiotherapy B. Neo-adjuvant chemotherapy C. Modified radical mastectomy D. Simple mastectomy

Reasoning + Answer:

<think>The initial treatment for a large palpable breast lump with skin involvement and axillary lymphadenopathy is to do a modified radical mastectomy which is the first step in the management of stage 2 or 3 breast cancer and includes removing the breast tissue and axillary lymph nodes and is the standard surgery for this stage of the cancer before any adjuvant therapy is given</think><answer>C. Modified radical mastectomy</answer>
