

Question:

Excitatory Neurotransmitter in CNS-Answer Choices:A. Acetyl cholineB. GlycineC. GABAD. Glutamate

Reasoning + Answer:

<think>Excitatory neurotransmitters are those that increase the likelihood of a neuron firing an action potential. In the central nervous system (CNS), glutamate is the primary excitatory neurotransmitter. It plays a crucial role in learning and memory processes. Glycine, on the other hand, is an inhibitory neurotransmitter. Acetylcholine and GABA (gamma-aminobutyric acid) are also neurotransmitters, but they are primarily involved in modulation of neuronal activity rather than being the main excitatory neurotransmitters in the CNS. </think><answer>D. Glutamate</answer>
