

Question:

All of the following antihistaminic agents lack anticholinergic property EXCEPT :Answer Choices:A. PromethazineB. AstemizoleC. LevocetirizineD. Loratadine

Reasoning + Answer:

<think>Antihistaminic agents can be divided into two types based on their side effects : those that cause anticholinergic effects (diphenhydramine , promethazine , astemizole) and those that do not (loratadine , levocetirizine). Astemizole , promethazine , and diphenhydramine block both H₁ and muscarinic receptors , which results in anticholinergic effects such as dry mouth , blurred vision , and urinary retention . On the other hand , loratadine and levocetirizine do not block muscarinic receptors and therefore do not cause anticholinergic effects . </think><answer>>D . Loratadine</answer>
